China's Trade Tensions with Japan: Will the US Profit?	25 X 1
Summary	
Beijing has intensified efforts begun in 1985 to reduce imports from Japan. China's persistent bilateral trade deficit and fears of becoming dependent on Japan—which supplies a dominant share of China's imports of key industrial commodities and equipment—are the major factors causing Beijing's anti-Japanese import restrictions. But proscriptions against importing from Japan also have become a lever Beijing uses to press Tokyo on a broad spectrum of issues—ranging from Beijing's perception that Japan and Taiwan have been developing a closer political and economic relationship to fears of a resurgence of Japanese militarism	
and unhappiness with Japanese restrictions on technology transfer to China.	25X1
Beijing's irritations with Japan are long-lived, in our view, but Japanese goods will remain essential to China's economic modernization program and a large Japanese market presence will remain in key sectors

Beijing also complains that Japanese suppliers are attempting to exploit their dominance in key sectors of China's economy. This concern has prompted China, since 1985, to attempt to diversify its sources of supply—looking to US and West European suppliers for equipment and commodities supplied primarily by Japan. Although Japan's share of China's imports of steel, industrial machinery, computers, telecommunications, scientific instruments, and vehicles has declined, Beijing remains concerned about Japanese dominance of the Chinese economy in these sectors. Chinese Customs statistics indicate, for example, that Japanese suppliers still provide at least half of China's imported power generating machinery, telecommunications equipment, electric machinery and apparatus, and steel.

25X1

Tokyo's View

Tokyo, for its part, has taken a hands-off approach to resolving the trade imbalance, which it regards as largely a private-sector matter. Tokyo nonetheless has echoed comments of Japanese businessmen that China needs to improve its investment environment in order to attract investment that will fuel export-oriented cooperative enterprises. Japanese statistics, moreover, indicate that the imbalance was nearly erased in 1987 as a result of rising prices for Chinese oil, strong Japanese energy demand, and reduced Chinese imports. Japanese Customs statistics show a yearend surplus of only \$852 million, one-fifth the level reached in 1986.

25X1

Countering Chinese charges of Japanese protectionism, Tokyo claims the problem lies in the low quality, poor variety, and unreliable delivery of Chinese export commodities—failings it cannot be expected to redress, although it is attempting to improve China's transportation infrastructure by providing concessional financing for port and rail construction projects. Tokyo, moreover, has shown some flexibility regarding import quotas for coal, oil, and textiles, although similar demands from Australia, South Korea, Indonesia, and other trading partners have kept quotas on Chinese products below the levels Beijing requested. Finally, in an apparent softening of its refusal to reallocate concessional project loans to support China's export industries, in October, then Prime Minister Nakasone announced plans to provide 100 billion yen (\$770 million) in official development assistance to China's export industries.

25X1

Tokyo demurs to the Chinese charges of market domination and disruption, citing Chinese purchasing decisions as responsible for the market position of Japanese suppliers.

Implications

signed contracts begin.

For Japanese Suppliers. Japan's share of China's imports has been declining—across—the—board, as well as in key sectors selected by Beijing—and Japanese firms will probably continue to see their marketing efforts in China yield less—than—expected returns. A reordering of Chinese import priorities away from consumer electronics and vehicles—for which Japan had been the leading supplier—and higher Japanese sales prices from appreciation of the yen have helped squeeze Japan's share of China's imports and reduce the bilateral deficit over the last few years. Over the next few years, Beijing's anti–Japanese import measures will contribute to this trend, in our view:

- Beijing's ambitious economic modernization program will continue to fuel demand for Japanese capital goods and construction materials, which in turn will fuel persistent concern in Beijing about Japanese domination of China's economy.
- As a result, Beijing will very likely continue from time-to-time to instruct traders to avoid Japanese products, at least in sectors in which the Japanese supply a dominant share of Chinese imports.
- China's reduced dependence on Japanese suppliers in 10 of the 12 commodity categories in which Japan held a dominant share of China's imports in 1984 or 1985 indicates that attractive Japanese prices, favorable financing, and a pervasive marketing presence are not always effective in winning Chinese contracts (see inset and figure 2).

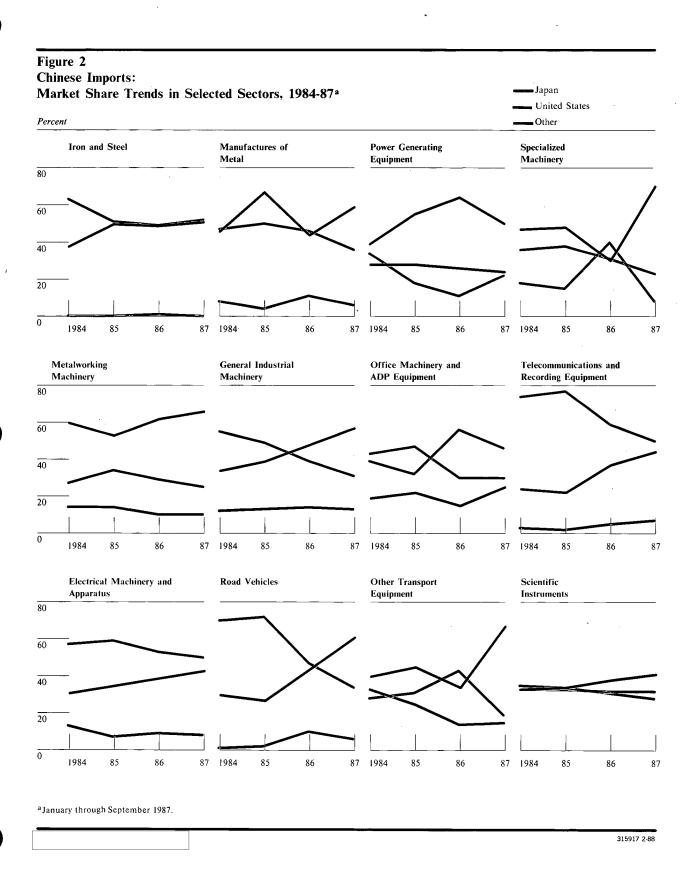

Beijing, naturally, will not halt all imports from Japan, nor will its directives be uniformly heeded at the provincial or municipal level, where exhaustive marketing efforts and concessional financing may still win contracts. Moreover, even though enforcement of many of the anti-Japanese import policies would further reduce Japan's market share in China, we believe Japan will remain one of China's foremost suppliers of industrial goods—especially high-technology goods where there are few alternate suppliers.

And for US Exporters. We anticipate that although the US share of China's imports may increase moderately over the next few years, such increases will reflect primarily improved export prices resulting from the dollar's decline, rather than the tensions in the Sino-Japanese economic relationship. For the most part, non-US suppliers appear to be benefiting more than US suppliers from Beijing's efforts to redirect trade away from Japan. From 1985 through September 1987, the US share of China's imports declined slightly, from 12 percent to 10 percent. During the same period, imports from countries other than Japan and the United States rose from 52 percent to 66 percent. West Germany has been the greatest beneficiary of Sino-Japanese trade frictions. The Soviet Union will also likely grab an increased share of China's imports of steel and power generating equipment as deliveries from recently

25X1

25X1

- 6 -SECRET

SECRET	

The US share of China's imports has increased in only three of the 10 categories in which Japan's has dropped:

- In two of the three categories in which US firms have picked up market share—computers and automated data processing equipment, and telecommunications and sound recording equipment—we suspect that the streamlining of US export controls has had a greater impact on the US market position than Beijing's anti-Japanese import directives.
- In the remaining category, road vehicles, Beijing's instructions probably contributed to the slight increase in the US market presence, but helped non-US suppliers even more; the US share increased from 2 percent in 1985 to 6 percent in the first three quarters of 1987, but suppliers from other countries increased their share of China's vehicle imports from 26 percent to 60 percent. Moreover, the increase in the US market share is of questionable importance, because China has sharply curbed its total purchases of road vehicles, and the dollar value of US road vehicle exports to China has actually declined.

Balancing these	modest	gains i	n market	share	is the	fact	that	the	us	share	of	China's
imports actually	declined	in an	equal nui	mber o	f prod	luct I	ines
